Note:

These are the top 25 open issues for the next release that are scheduled in our [issue tracking system](#) (see [all](#) open issues). The listing below is regenerated on each Forrest run.

1. [FOR-144] define new format for skinconf.xml

<http://issues.apache.org/jira/browse/FOR-144>

We are attempting to define a new extensible skinconf format. Here is one thread where the discussion is happening (there were some other threads leading up to that). <http://marc.theaimsgroup.com/?t=108315759100005>

<http://marc.theaimsgroup.com/?t=108315759100005>

2. [FOR-588] Design new configuration system

<http://issues.apache.org/jira/browse/FOR-588>

We need a new config system for Forrest for various reasons: the initial config system was known to be limited; to enable the specification of multiple Forrest sites within a single instance of Forrest; to accommodate the changes brought about by forrest:views, themes, and plugins.

3. [FOR-713] HTML-to-document.xsl no longer generates an XDoc

<http://issues.apache.org/jira/browse/FOR-713>

html-to-document.xsl no longer converts content to an XDoc. Instead it renders converts documents to XDoc, instead it allows H1, H2 etc. elements to pass through. The result is a page that seems to render correctly and in the single test case I have used it still renders correctly in PDF and Text format. However, this is a backward incompatible change that will break sites that use includes with XPath statements such as /section[@id="foo"] (sections are no longer created)

4. [FOR-591] MaxMemory needs increasing

<http://issues.apache.org/jira/browse/FOR-591>

Since the docs restructuring for the 0.7 release it has become necessary to increase the maxmemory to be able to build the Forrest site. Does this indicate a memory leak? Does someone have the tools to run some diagnostics? (NB maxmemory has been increased in forrest.properties, if we resolve this issue it should be reduced again)

5. [FOR-572] run a memory profiler while forrest is operating

<http://issues.apache.org/jira/browse/FOR-572>

We need to run a memory profiler while forrest is operating.

6. [FOR-701] Missing locationmap entry gives poor error

<http://issues.apache.org/jira/browse/FOR-701>

If there is no locationmap entry for a resource we get a "resource not found" error. This is fine if it is the actual source file that is missing. However, now that we are using the LM to find other intermediate resources, such as stylesheets etc. it can be misleading.

 We need to throw a meaningful error when a resource cannot be found.

7. [FOR-654] Create Schema for XHTML2 subset

<http://issues.apache.org/jira/browse/FOR-654>

We need a RelaxNG schema for the subset of XHTML identified in:
 <http://marc.theaimsgroup.com/?l=forrest-dev&m=112489488330888&w=2>

8. [FOR-707] Document i18n features of Forrest

<http://issues.apache.org/jira/browse/FOR-707>

There is next to no documentation about i18n, just a pretty poor FAQ entry that points at an issue that has now been closed.

 Cheche wrote a blog entry on his work:
 <http://casa.che-che.com/blog/2005/05/10/internalization-a-site-using-forrest-07-dev/>

 We could, at the very least use the locationmap to pull this content into our site [OT: I wonder if this could be a way to generate more documentation?]

9. [FOR-630] Forrest strategy and direction

<http://issues.apache.org/jira/browse/FOR-630>

Topics for discussion gathered at ApacheCon EU 2005.

 WARNING: Only reply to the general theme of this topics list. Please create separate threads for each specific topic.

 Actually we should be using Jira for some of this.

 How about discussing on the mailing list, and putting summaries into Jira.

 I have the scraps of paper that Nicola Ken wrote.

 Photographs are in:
 <http://svn.apache.org/repos/asf/forrest/events/apachecon-eu-2005>

 Ross helped me to interpret some of the squiggles, but there are still some obscure parts (marked with #? below). The items are raw, i have not tried to explain any or add others.

 List of topics is in no particular order and it is not complete. We spent maybe 15 minutes brainstorming. We had a first quick pass at assigning some priority.

 I don't understand NKBs priority symbols.

 Anyway some items were marked with

 circle ... [C]
 square ... [S]

 Then we went straight on to the top topic:

 "configuration" and spent the rest of the day.

 *
 Create lenya/forrest publication.

 * [C] Naming convention for "views".

 * Roadmap specifically for views.

 * [S] i18n support with locationmap.

 * Locationmap - what is needed to complete it.

 * [C] Configuration |> apache #?

 * TraversableSource ...

 * Source resolving for locationmap.

 * [C] How views are interacting with locationmap?

<http://issues.apache.org/jira/browse/FOR-388>

11. [FOR-675] upgrading to commons-jxpath-1.2.jar causes failures with linkrewriter protocols site: etc.

<http://issues.apache.org/jira/browse/FOR-675>

12. [FOR-711] Cache results from the Locationmap

<http://issues.apache.org/jira/browse/FOR-711>

13. [FOR-490] serve multiple sites on a single Forrest instance

<http://issues.apache.org/jira/browse/FOR-490>

Nicola Ken Barozzi wrote:
> After that, it would be beneficial to be able to serve
> multiple sites on a single Forrest instance, so that we
> can have other projects join and
> have their site served.
This last point (seving multiple "sites" from one
Forrest instance) is important even without moving Forrest to a
live server (I'm +1 on
this).
Right now we have various styleguides in Forrest and if I need to run them at

once I have to start Forrest/jetty
 with different ports.

 (From Thread "[RT] Serving Apache Forrest site from live Forrest"
 on dev-list. Will add link later.)

14. [FOR-343] Upgrading Plugins

<http://issues.apache.org/jira/browse/FOR-343>

Currently when installing a plugin Forrest attempts to install the most suitable version available. However, it makes no attempt to upgrade plugins when an upgrade becomes available.

 We need a target in the buildfile that will upgrade an indicated plugin when possible. This can then (optionally) be used when running Forrest to automatically upgrade plugins.

15. [FOR-284] link rewriting broken when linking to xml source views which contain site: links

<http://issues.apache.org/jira/browse/FOR-284>

When linking to *.xml files (e.g. to demonstrate a source file) then if that file contains "site:" or "ext:" links, then they are reported as broken, e.g. docs/site:dtd-docs

16. [FOR-241] character entities (e.g. ampersand) are expanded again for href or src attributes

<http://issues.apache.org/jira/browse/FOR-241>

If I have a url like this inside the XML source:

 http://sourceforge.net/sflogo.php?g

 validate-xdocs fails because it wants the literal & to be typed out as
 &
instead. So I correct it to become:

 http://sourceforge.net/sflogo.php?g

 However, the generated HTML has the entity resolution UNDONE!:

 http://sourceforge.net/sflogo.php?g

 This HTML fails validation as 4.01 transitional.

 David Crossley adds:

There is a demonstration of the problem in the document

src/documentation/content/xdocs/docs/dreams.xml
 The ampersand in the link element text is properly handled but
 the ampersand in the link href attribute is not.

17. [FOR-210] whole-site html and pdf: broken link faq, broken image links

<http://issues.apache.org/jira/browse/FOR-210>

The "fresh-site" build from 'forrest seed site' reports some failures for faq.html and various missing images. Wonder if sitemap issue?

18. [FOR-209] First level selected tab is not highlighted when containing 2nd level tabs

<http://issues.apache.org/jira/browse/FOR-209>

24. [FOR-157] skin-descriptors comma separated list fails

<http://issues.apache.org/jira/browse/FOR-157>

The second link does **not** read the url of the skin correctly.

 I repeated today the steps with a second skin:
 1) create the skin
 2) forrest package-skin
 3) defined it in my descriptor
 4) checked with "forrest available-skins"
 5) forrest

 and it worked :)

 ... dunno why it have not yesterday.

 Yes I do! I just changed:

forrest.skins.descriptors=http://www.apache.org/~thorsten/w
to
 forrest.skins.descriptors=<a

href="http://xml.apache.org/forrest/skins/skins.xml,http://www.apache.org/~thorsten/whiteboard/forrestskins/sk

 Trying to say something wrong with the "comma seperated list,".. The second link do
not work. In detail the url of the skin.

 I just double checked as well the file:///d:/get/skins.xml and it worked. When it stands alone but not
in the comma seperated list.

25. [FOR-143] Encoding of HTML files should be configurable

<http://issues.apache.org/jira/browse/FOR-143>

From: Fabrice Bacchella

 By default, HTML files are encoded in ISO-8859-1 because
of the way the Cocoon's HTML serialiser is declared in sitemap.xmap :

 <map:serializer

name="html" mime-type="text/html"

src="org.apache.cocoon.serialization.HTMLSerializer">

 <doctype-public>--W3C//DTD HTML 4.01

Transitional//EN</doctype-public>

 <doctype-system><a

href="http://www.w3.org/TR/html4/loose.dtd</doctype-system">http://www.w3.org/TR/html4/loose.dtd&an

</map:serializer>

 The default one is such a case is ISO-8859-1. And it even add a
META inthe HTML result. But here in French, ISO-8859-15 is better because of the =AB e dans l'o
=BB character : =9C. In Russian or Asia, the
 situation is even worse.

 Is that possible to
add a properties in forrest.properties saying for example :
 project.encoding=UTF-8

 and
adding a <encoding>@project.encoding@</encoding> element in the
 HTML
serializer ?

 And in a more general way, where can I find a document about the way
properties are used by forrest ? Which files use them ? How to add a
 new one ?
