

Feeder Plugin - Single Feed Example

This sample shows how a single RSS feed can be converted to an XDoc and included in a Forrest site. In order to do this you must first create a `feedDescriptor` file. This describes all the feeds that your project knows about. A simple example is:

```
<feedDescriptor>
  <feed id="planetApache">
    <url>http://www.planetapache.org/rss20.xml</url>
  </feed>
</feedDescriptor>
```

In order to embed the data from the `planetApache` feed you create a link in the following form:

```
<a href="PATH_TO_FEED_DESCRIPTOR/feeder/FEED_DESCRIPTOR_NAME.EXTENSION">
```

In this URL you must replace `PATH_TO_FEED_DESCRIPTOR` with the directory path to your feed descriptor file, `FEED_DESCRIPTOR_NAME` with the name of the descriptor file, and `EXTENSION` with the extension indicating the format you want the feed to be delivered in (i.e. `html`, `pdf` etc.)

For example </samples/feeder/feedDescriptor.html> will display the feed shown above.

Warning:

The way URLs are structured is due to change in the near future, use at your own risk (see Forrest mailing lists for discussion).
