Feeder Plugin - Aggregate Feed example

This sample shows how a number of different feeds can be aggregated into a single feed and then displayed in a Forrest site. Creating an aggregated feed is no different to embedding a single feed. Simply add more feeds into your feed descriptor file and then link to it in the same way.

For example:

```
<feedDescriptor>
<feed id="planetApache">
  <url>http://www.planetapache.org/rss20.xml</url>
</feed>
<feed id="planetJava">
  <url>http://planetjava.org/rss.php</url>
</feed>
</feedDescriptor>
```

Take a look at what the above file produces.
